

Enabling a data-informed public sector: From hype to action using the Big Data Test Infrastructure (BDTI)

The BDTI is a **ready-to-use** and **free*** **analytics cloud platform**, based on **open source** tools, which aims to help European public administrations to **experiment with data** and **derive insights** to support them in their decision-making.

The BDTI has already helped public sector entities to:

- **Derive insights** about mobility to redesign services in Italy
- **Support** clinicians by extracting knowledge from articles in Spain
- **Help** the European Blood Alliance to investigate therapy efficiency for COVID-19
- **Analyse and Improve** public transportation efficiency in Finland.
- **Monitor and Predict** tree heath from resistivity readings in Germany.

If you are a **public sector entity** looking for a data playground, **your organisation could be next!**

Contact us and apply for BDTI:
